

Ventilation

In order to reduce condensation and to let out smoke when making a fire, good ventilation is important.

Nordic tipis from Tentipi are equipped with:

- * a ventilator cap - single or double depending on the model
- * fresh air intakes - varying number depending on the model
- * door fitted with mosquito net - on all models of tent
- * mosquito net roof - fitted on certain models of tents and all inner tents.

The ventilator cap is adjusted from inside the tent using our patented In-Tent Vent™ system. When the mosquito net roof is in use, the regulating tube must be fixed onto the central pole.

When an open fire or stove is in use, the regulating tube and the mosquito net roof must be fixed in place against the tent fabric.

The fresh air intakes are adjusted from inside the tent.

Stretch the air intake roof on the outside of the Nordic tipi.

The mosquito net door can also be used as a fresh air intake.
